

EQACC SOLAR

What is BC solar panel

Overview

Back Contact (BC) solar modules are photovoltaic panels in which all the electrical contacts — both positive and negative — are located on the rear side of the solar cell. What is a BC solar cell?

This means the front of the cell, which faces the sun, has no metal lines (called gridlines) obstructing it. The concept of BC solar cells was first introduced in 1975 and has evolved over the years to become one of the most efficient solar technologies available today. How Does a BC Solar Cell Work?

.

Can BC solar cells be used with other solar technologies?

Versatile Use: BC solar cells can be combined with other solar technologies like PERC, TOPCon, and HJT to create even more efficient hybrid cells. For example, combining BC technology with HJT cells forms an HBC cell, which boasts very high efficiency rates.

How does a BC solar cell work?

In a typical solar cell, metal gridlines on the front side capture sunlight and convert it into electricity. However, these gridlines block some of the sunlight, reducing the cell's efficiency. In a BC solar cell, the front side is entirely free of these obstructions.

What is a back contact solar cell?

These lines are actually the front contacts that collect the electricity generated by the panel. Now, imagine a solar cell without these lines on the front. This is what we call a Back Contact (BC) solar cell. In BC solar cells, all the electrical contacts are moved to the back of the cell, allowing the front to capture more sunlight.

What is BC solar panel

What is a back contact (BC) solar cell and why ...

If you're familiar with solar panels, you might have seen the grid-like patterns of thin metal lines on their surfaces. These lines are ...
