# What is a temperature difference solar container battery

## Overview

---

Is temperature uniformity a problem in battery energy storage systems?

The temperature uniformity of batteries was analyzed under a wide range of supply liquid temperatures within a limited operation cycle. The conventional liquid cooling system carries the risk of dew condensation and air cooling has poor thermal management performance for battery energy storage systems.

Does a two-phase liquid cooling system affect containerized battery thermal management?

To comprehensively analyze the effect of the two-phase liquid cooling system on containerized battery thermal management, several key parameters were tested, including the battery temperature, cooling system, and climate conditions: the temperature of the battery cells, the cold plate temperature, and the outdoor temperature and humidity.

What is the maximum temperature difference of battery cells?

In most of the pack, the temperature difference between the inlet and outlet of the cold plate ( $\Delta T_{\text{max.plate}}$ ) is very small, and the maximum is only 1 °C, thus resulting in battery cells exhibiting excellent temperature uniformity. The maximum temperature difference of battery cells ( $\Delta T_{\text{max.cell}}$ ) is below 3 °C.

What is the temperature difference between battery pack and air cooling system?

The temperature difference among the cells within each battery pack is maintained within 2 °C throughout the entire charging process, which is not only within the safe working temperature range but also reduced by 60% compared to the 4.7 °C temperature difference of the traditional air cooling system (Guo et al., 2023, Huang et al., 2022).
