What is an uninterruptible power supply (UPS)?

Uninterruptible Power Supply, or UPS, is more than just a bulky box that sits quietly in a corner of your office or data centre. It ensures your critical systems keeps going even when the power grid doesn't. But what exactly is this device, and why should you care?

UPS systems are not flashy, they don't make headlines, but they're indispensable.

What is uninterruptible power supply classification?

Uninterruptible power supply classification According to the working principle, it is divided into: backup, online, online interactive. Backup UPS: When the mains is normal, the mains directly supplies power to loads. The UPS starts the inverter only when the mains is abnormal.

What are the components of uninterruptible power supply?

The basic components of uninterruptible power supply: Battery pack: provides backup power to the UPS. When the mains power fails, the battery pack can supply power to the load. Charger: When the mains is normal, the charger charges the battery pack. Inverter: Converts direct current (DC) to alternating current (AC) to power the load.

What are the different types of ups power supply?

Typically, according to different working principles, UPS power supply covers standby (offline) UPS, line-interactive UPS, online (double-conversion) UPS. The standby UPS system offers only the most basic features, providing surge protection and battery backup. Thus, its power supply quality is not good enough and the cost is much lower.
