## Overview

---

There are several reasons a BMS would end up in protection mode and sleep mode is basically an extended version of protection mode. For example, when a lithium-ion battery is at around 30 percent capacity.

Can you wake up a lithium battery?

For voltages under 2V per cell, you should not attempt to wake up the battery, as it may be unsafe or permanently damaged. Always use a dedicated lithium charger for accurate voltage detection and safe charging. Many modern li-ion chargers feature a boost or recovery mode designed to safely wake up lithium battery packs from deep discharge.

How to wake up a sleeping Li-ion battery?

When you want to know how to awaken a sleeping li-ion battery, always start by checking voltage and using a charger with boost mode. These methods help you wake up a li-ion pack safely. Improved cooling, as shown below, supports battery safety during the process.

Why does my lithium battery go into sleep mode?

If you find that your lithium battery is no longer charging or functioning, it might have entered this sleep mode. This guide explains why lithium batteries go into sleep mode and provides safe, practical methods to wake them up and restore their functionality. What Causes a Lithium Battery to Go into Sleep Mode?

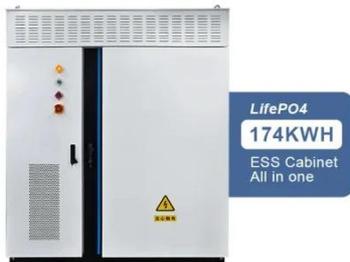

.

What happens if a battery sleeps?

In some cases, the sleep state is intentionally triggered to protect the battery from damage. During this sleep state, the BMS may shut off its output, making it appear as though the battery is completely dead. However, the cells themselves may still have some residual capacity, albeit at a very low voltage.
