How do solar panels turn sunlight into electricity?

Solar cells consist of layers of silicon that turn sunlight into electricity, but it takes more equipment than just that to get energy from the sun into your toaster. You've probably wondered what kind of magic in solar panels converts sunlight into electricity. It's not magic. It's science. Specifically, it's the photovoltaic effect.

How do solar panels work?

Solar panels use a scientific concept called the photovoltaic effect to turn sunlight into electricity. Here's a deep dive into how it all works. Solar cells consist of layers of silicon that turn sunlight into electricity, but it takes more equipment than just that to get energy from the sun into your toaster.

How do solar panels generate usable electricity?

Solar arrays create a usable electricity system for your home by producing direct current (DC) electricity. This is achieved through the photovoltaic effect, where solar cells convert sunlight into electrical energy.

What happens when sunlight strikes a solar panel?

When sunlight strikes a solar panel, it excites electrons within the solar cells, generating an electric current. Solar panels are made of semiconductor materials, typically silicon. These materials have unique properties that allow them to absorb sunlight and generate an electrical charge. 1. Solar Cells (Photovoltaic Cells)
