# Wind and solar energy storage usage time

## Overview

---

Can energy storage capacity be allocated in wind and solar energy storage systems?

This article studies the allocation of energy storage capacity considering electricity prices and on-site consumption of new energy in wind and solar energy storage systems. A nested two-layer optimization model is constructed, and the following conclusions are drawn:

How are energy storage systems connected to wind power?

Wind power, photovoltaic cells, and energy storage systems are connected to wind and solar storage systems through their respective converters and connected to the external power grid. According to the characteristics of electricity consumption, loads can be divided into two categories: fixed load and flexible load.

How can energy storage improve the value of wind and solar resources?

Energy storage can enhance the value of wind and solar resources due to its fast response and flexible charging and discharging characteristics. At present, the cost of energy storage is relatively high, and it is necessary to reasonably optimize configuration capacity and fully coordinate the availability and economy of energy storage.

What are the decision variables for wind and solar energy storage?

The configuration power and capacity of energy storage in the wind and solar storage system are used as the decision variables, and the problem of considering the on-site consumption rate of new energy such as wind and solar and the configuration cost of energy storage is described in the inner layer.
